

Obfuscating aes.c with Tigress

Prepared by: Shane Reilly

Email: reillysp@mail.uc.edu

Class of 2023, University of Cincinnati, Computer Science

These instructions will show how to obfuscate the SubBytes function inside of the TinyAES aes.c with Tigress for use in the STM32F3 target board. The instructions are identical for XMEGA, but the Virtualize obfuscation will not be available for that architecture. These instructions assume that you are using the virtual machine provided by ChipWhisperer that is available under the releases tab of their GitHub repo (<https://github.com/newaetech/chipwhisperer/releases>) and that is already set up with their provided directions (located at <https://chipwhisperer.readthedocs.io/en/latest/installing.html>).

1. Download the latest version of Tigress from <https://tigress.wtf/>
2. Unzip the file and navigate inside the tigress folder.
3. Follow the instructions located in tigress/INSTALL regarding setting the TIGRESS_HOME environment variable and the PATH.
4. Obtain aes.c from <https://github.com/newaetech/chipwhisperer/tree/develop/hardware/victims/firmware/crypto/tiny-AES128-C>
5. Inside of aes.c, remove the line `#include "aes.h"`. Now, add the contents of aes.h to the top of aes.c.
6. Now, use tigress to create obfuscated samples with the following commands:

Virtualize:

```
tigress --Environment=armv7:Linux:Gcc:4.6 --Transform=Virtualize --  
Functions=SubBytes --out=aes-virtualize.c ./aes.c
```

Flatten:

```
tigress --Environment=armv7:Linux:Gcc:4.6 --Transform=Flatten --  
Functions=SubBytes --out=aes-flatten.c ./aes.c
```

Split:

```
./tigress --Environment=armv7:Linux:Gcc:4.6 --Transform=Split --  
Functions=SubBytes --out=aes-split.c ./aes.c
```

Encode Arithmetic:

```
tigress --Environment=armv7:Linux:Gcc:4.6 --Transform=EncodeArithmetic --  
Functions=SubBytes --out=aes-encode.c ./aes.c
```

7. After these files are transformed, they will need to be edited to be used:

- Place `#include "aes.h"` at the top.
- Remove all function declarations that are in the aes.h file (AES128_ECB_indp_crypto, AES128_ECB_decrypt, AES128_ECB_encrypt, AES128_ECB_indp_setkey)

- Remove functions megaInit(), state_i\$nit(), main(), input_save_i\$nit, sbox_i\$nit, RoundKey_i\$nit, Key_i\$nit, Rcon_i\$nit, rsbox_i\$nit
- Remove the __uint_t typedefs and any of the standard library function declarations that were not originally included in aes.c. (do not remove xtime)
- Add in the following if they are not already there:

```
AES_CONST_VAR uint8_t sbox[256] = {
    //0    1    2    3    4    5    6    7    8    9    A    B    C    D    E    F
    0x63, 0x7c, 0x77, 0x7b, 0xf2, 0x6b, 0x6f, 0xc5, 0x30, 0x01, 0x67, 0x2b, 0xfe, 0xd7, 0xab, 0x76,

```

```

AES_CONST_VAR uint8_t Rcon[11] = {

```

```

    0x8d, 0x01, 0x02, 0x04, 0x08, 0x10, 0x20, 0x40, 0x80, 0x1b, 0x36

```

```

};

```

8. Sample post-obfuscation source code files are located in the SoftPower/samples directory.
9. When ready to use the obfuscated version, place output back inside the hardware/victims/firmware/crypto/tiny-AES128-C directory. Ensure the name of the file is aes.c. Compile as normal.
